Advanced Troubleshooting Guide for Air Brake Compressors

The guide consists of an introduction to air brake charging system components, a table showing recommended vehicle maintenance schedules, and a troubleshooting symptom and remedy section with tests to diagnose most charging system problems.

INDEX

Symptom | Page Number
---|---
**Air** |  
Air brake charging system:
- Slow build (9.0) ............... 9 - 10
- Doesn't build air (10.0) ........... 11
Air Dryer:
- Doesn't purge (14.0) ............. 12
- Safety valve releases air (12.0) ........ 12
Compressor:
- Constantly cycles (15.0) ............. 13
- Leaks air (16.0) ................. 13
- Safety valve releases air (11.0) ........... 11
- Noisy (18.0) ...................... 13
Reservoir:
- Safety valve releases air (13.0) ........... 12

Symptom | Page Number
---|---
**Coolant** |  
- Compressor leaks coolant (17.0) ........... 13

**Engine** |  
- Oil consumption (6.0) ................. 9

**Oil** |  
- Oil Test Card results (1.0) ................. 4
- Oil is present:
  - On the outside of the compressor (2.0) ........... 5
  - At the air dryer purge/exhaust or surrounding area (3.0) ........... 5
  - In the supply reservoir (4.0) ........... 6 - 8
  - At the valves (5.0) .................. 8
  - At air dryer cartridge (7.0) ............... 9
  - In the ping tank or compressor discharge aftercooler (8.0) ............... 9

---

**Test Procedures**

(1) Oil Leakage at Head Gasket ........... 14
(2) System Leakage .................. 14
(3) Compressor Discharge and Air Dryer Inlet Temperature ........... 14
(4) Governor Malfunction ........... 14
(5) Governor Control Line ........... 15
(6) Compressor Unloader ........... 15
BASIC Test Information ........... 17-19

**Maintenance & Usage Guidelines**

Maintenance Schedule and Usage Guidelines (Table A) ........... 3

Bendix

*This guide is only for vehicles that use desiccant air dryers.*
Introduction to the Air Brake Charging System

Powered by the vehicle engine, the air compressor builds the air pressure for the air brake system. The air compressor is typically cooled by the engine coolant system and lubricated by the engine oil supply.

The compressor's unloader mechanism and governor (along with a synchro valve for the Bendix® DuraFlo 596™ air compressor) control the brake system air pressure between a preset maximum and minimum pressure level by monitoring the pressure in the service (or "supply") reservoir. When the air pressure becomes greater than that of the preset "cut-out", the governor controls the unloader mechanism of the compressor to stop the compressor from building air and also causes the air dryer to purge. As the service reservoir air pressure drops to the "cut-in" setting of the governor, the governor returns the compressor back to building air and the air dryer to air drying mode.

As the atmospheric air is compressed, all the water vapor originally in the air is carried along into the air system, as well as a small amount of the lubricating oil as vapor.

The duty cycle is the ratio of time the compressor spends building air to the total engine running time. Air compressors are designed to build air (run "loaded") up to 25% of the time. Higher duty cycles cause conditions that affect air brake charging system performance which may require additional maintenance. Factors that add to the duty cycle are: air suspension, additional air accessories, use of an undersized compressor, frequent stops, excessive leakage from fittings, connections, lines, chambers or valves, etc.

The discharge line allows the air, water-vapor and oil-vapor mixture to cool between the compressor and air dryer. The typical size of a vehicle's discharge line, (see column 2 of Table A on page 3) assumes a compressor with a normal (≤ 25%) duty cycle and operating in a temperate climate. See Bendix and/or other air dryer manufacturer guidelines as needed.

When the temperature of the compressed air that enters the air dryer is within the normal range, the air dryer can remove most of the charging system oil. If the temperature of the compressed air is above the normal range, oil — as oil-vapor — is able to pass through the air dryer and into the air system. Larger diameter discharge lines and/or longer discharge line lengths can help reduce the temperature.

The discharge line must maintain a constant slope down from the compressor to the air dryer inlet fitting to avoid low points where ice may form and block the flow. If, instead, ice blockages occur at the air dryer inlet, insulation may be added here, or if the inlet fitting is a typical 90 degree fitting, it may be changed to a straight or 45 degree fitting. For more information on how to help prevent discharge line freeze-ups, see Bendix Bulletins TCH-008-021 and TCH-008-022 (available on www.bendix.com). Shorter discharge line lengths or insulation may be required in cold climates.

The air dryer contains a filter that collects oil droplets, and a desiccant bed that removes almost all of the remaining water vapor. The compressed air is then passed to — and stored in — the air brake service (supply) reservoir. The oil droplets and the water collected are automatically purged when the governor reaches its "cut-out" setting.

For vehicles with accessories that are sensitive to small amounts of oil, we recommended installation of a Bendix® PuraGuard® oil coalescing filter, designed to further minimize the amount of oil present.
Table A: Maintenance Schedule and Usage Guidelines

Regularly scheduled maintenance is the single most important factor in maintaining the air brake charging system.

</table>

Footnotes:
1 With increased air demand, the air dryer cartridge needs to be replaced more often.
2 Use the drain valves to slowly drain all reservoirs to zero psi.
3 Allow the oil/water mixture to fully settle before measuring oil quantity.
4 To counter above normal temperatures at the air dryer inlet, (and resultant oil-vapor passing upstream in the air system) replace the discharge line with one of a larger diameter and/or longer length. This helps reduce the air’s temperature. If sufficient cooling occurs, the oil-vapor condenses and can be removed by the air dryer. Discharge line upgrades are not covered under warranty. Note: To help prevent discharge line freeze-ups, shorter discharge line lengths or insulation may be required in cold climates. (See Bendix Bulletins TCH-008-021 and TCH-008-022, available on www.bendix.com.)
5 For certain vehicles/applications, where turbo-charged inlet air is used, a smaller size compressor may be permissible.

Note: Compressor and/or air dryer upgrades are recommended in cases where duty cycle is greater than the normal range (for the examples above).

For Bendix® Tu-Flo® 550 and 750 compressors, unloader service is recommended every 250,000 miles.
Air Brake Charging System Troubleshooting

How to use this guide:
Find the Symptom(s) that you see, then move to the right to find the possible causes (“What it may indicate”) and remedies (“What you should do”).

Review the warranty policy before performing any intrusive compressor maintenance. Unloader or cylinder head gasket replacement and resealing of the bottom cover plate are usually permitted under warranty. Follow all standard safety procedures when performing any maintenance.

Look for:

- Normal - Charging system is working within normal range.
- Check - Charging system needs further investigation.

### GENERAL SAFETY GUIDELINES

**WARNING! PLEASE READ AND FOLLOW THESE INSTRUCTIONS TO AVOID PERSONAL INJURY OR DEATH:**

- ▲ Park the vehicle on a level surface, apply the parking brakes and always block the wheels. Always wear personal protection equipment.
- ▲ Stop the engine and remove the ignition key when working under or around the vehicle. When working in the engine compartment, the engine should be shut off and the ignition key should be removed. Where circumstances require that the engine be in operation, EXTREME CAUTION should be used to prevent personal injury resulting from contact with moving, rotating, leaking, heated or electrically-charged components.
- ▲ Do not attempt to install, remove, disassemble or assemble a component until you have read, and thoroughly understand, the recommended procedures. Use only the proper tools and observe all precautions pertaining to use of those tools.
- ▲ If the work is being performed on the vehicle’s air brake system, or any auxiliary pressurized air systems, make certain to drain the air pressure from all reservoirs before beginning ANY work on the vehicle. If the vehicle is equipped with a Bendix® AD-IS® air dryer system, a Bendix® DRM™ dryer reservoir module, or a Bendix® AD-9si™ air dryer, be sure to drain the purge reservoir.
- ▲ Following the vehicle manufacturer’s recommended procedures, deactivate the electrical system in a manner that safely removes all electrical power from the vehicle.
- ▲ You should consult the vehicle manufacturer’s operating and service manuals, and any related literature, in conjunction with the Guidelines above.

### Symptom: What it may indicate: What you should do:

![Diagram](image)

**3.0 Oil at air dryer purge/exhaust or surrounding Area**

Air brake charging system functioning normally.  

Air dryers remove water and oil from the air brake charging system.  

Check that regular maintenance is being performed. Return the vehicle to service.  

An optional kit (Bendix piece number 5011327 for the Bendix AD-IS® or AD-IP® air dryers, or 5003838 for the Bendix AD-9® air dryer) is available to redirect the air dryer exhaust.
4.0 Oil in supply or service reservoir (air dryer installed)

(a) If air brake charging system maintenance has not been performed. That is, reservoir(s) have not been drained per the schedule in Table A on page 3, Column 4, and/or the air dryer maintenance has not been performed as in Column 3.

(b) If the vehicle maintenance has been performed as recommended in Table A on page 3, some oil in the reservoirs is normal.

Drain all air tanks into the Bendix® BASIC™ test cup. (Bendix kit P/N 5013711).

Drain all air tanks and check the vehicle at next service interval using the Bendix® BASIC test. See Table A on page 3, column 3 and 4, for recommended service schedule.

Check

If less than one unit of reservoir contents is found, the vehicle can be returned to service. Note: If more than one oil unit of water (or a cloudy emulsion mixture) is present, change the vehicle’s air dryer, check for air system leakage (Test 2, on page 14), stop the inspection and check again at the next service interval.

See the BASIC test kit for full details.

If less than one "oil unit" of water (or water/cloudy emulsion mixture) is present, use the BASIC cup chart on the label of the cup to determine if the amount of oil found is within the acceptable level.

If within the normal range, return the vehicle to service. For vehicles with accessories that are sensitive to small amounts of oil, consider a Bendix® PuraGuard® oil coalescing filter.

If outside the normal range go to Symptom 4.0(c).

Also see Table A on page 3, Column 3 for recommended air dryer cartridge replacement schedule.

(c) Air brake system leakage.

(d) Compressor may be undersized for the application.

The duty cycle is the ratio of time the compressor spends building air to total engine running time. Air compressors are designed to build air (to "run loaded") up to 25% of the time. Higher duty cycles cause conditions that affect air brake charging system performance which may require additional maintenance. Factors that add to the duty cycle are: air suspension, additional air accessories, use of an undersized compressor, frequent stops, excessive leakage from fittings, connections, lines, chambers or valves, etc.

Go to Test 2 on page 14.

See Table A Column 1, on page 3 for recommended compressor sizes.

If the compressor is "too small" for the vehicle’s role (for example, where a vehicle’s use has changed or service conditions exceed the original vehicle or engine OE spec’s) then upgrade the compressor. Note: The costs incurred (e.g. installing a larger capacity compressor, etc.) are not covered under original compressor warranty.

If the compressor is correct for the vehicle, go to Symptom 4.0 (e).
### Symptom: 4.0 Oil in supply or service reservoir* (air dryer installed) (continued)

<table>
<thead>
<tr>
<th>Symptom</th>
<th>What it may indicate</th>
<th>What you should do</th>
</tr>
</thead>
</table>
| (e) Air compressor discharge and/or air dryer inlet temperature too high. | ![Image](testing_temperature_at_discharge_fitting.png) | ![Image](inspecting_coolant_hoses.png) | ![Image](kinked_discharge_line_shown.png) | **Temperature**

- Check temperature as outlined in Test 3 on page 14. If temperatures are normal go to 4.0(h).

- Inspect coolant line. Replace as necessary (I.D. is 1/2").

- Inspect the coolant lines for kinks and restrictions and fittings for restrictions. Replace as necessary.

- Verify coolant lines go from engine block to compressor and back to the water pump. Repair as necessary.

- If discharge line is restricted or more than 1/16" carbon build up is found, replace the discharge line. See Table A, column 2, on page 3 for recommended size. Replace as necessary.

- The discharge line must maintain a **constant slope** down from the compressor to the air dryer inlet fitting to avoid low points where ice may form and block the flow. If, instead, ice blockages occur at the air dryer inlet, insulation may be added here, or if the inlet fitting is a typical 90 degree fitting, it may be changed to a straight or 45 degree fitting. For more information on how to help prevent discharge line freeze-ups, see Bendix Bulletins TCH-008-021 and TCH-008-022. Shorter discharge line lengths or insulation may be required in cold climates.

| (g) Restricted discharge line. | ![Image](kinked_discharge_line_shown.png) |

| (h) Restricted air inlet (not enough air to compressor). | ![Image](partly_collapsed_inlet_line_shown.png) | **Other**

- Check compressor air inlet line for restrictions, brittleness, soft or sagging hose conditions etc. Repair as necessary. Inlet line size is 3/4 ID. Maximum restriction requirement for compressors is 25 inches of water.

- Check the engine air filter and service if necessary (if possible, check the air filter usage indicator).

*If a maintained Bendix® PuraGuard® system filter or Bendix® PuraGuard® oil coalescing filter is installed, call 1-800-AIR-BRAKE (1-800-247-2725) option 2 and speak to a Tech Team member.
### Symptom: Oil in supply or service reservoir* (air dryer installed (continued))

<table>
<thead>
<tr>
<th>Symptom</th>
<th>What it may indicate:</th>
<th>What you should do:</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Poorly filtered inlet air (poor air quality to compressor).</td>
<td>Check for leaking, damaged or defective compressor air inlet components (e.g. induction line, fittings, gaskets, filter bodies, etc.). Repair inlet components as needed. <strong>Note:</strong> Dirt ingestion will damage compressor and is not covered under warranty.</td>
<td></td>
</tr>
<tr>
<td>(j) Governor malfunction or setting.</td>
<td>Go to Test 4 on page 15.</td>
<td></td>
</tr>
<tr>
<td>(k) Compressor malfunction.</td>
<td>If you found excessive oil present in the service reservoir in step 4.0 (b) above and you did not find any issues in steps 4.0 (c) through 4.0 (j) above, the compressor may be passing oil. Replace compressor. If still under warranty, follow normal warranty process. <strong>Note:</strong> After replacing a compressor, residual oil may take a considerable period of time to be flushed from the air brake system.</td>
<td></td>
</tr>
</tbody>
</table>

*Cranckcase Flooding Consider installing a compressor bottom drain kit (where available) in cases of chronic oil passing where all other operating conditions have been investigated. Bendix® compressors are designed to have a ‘dry’ sump and the presence of excess oil in the crankcase can lead to oil carryover.*

5.0 Oil present at valves (e.g. at exhaust, or seen during servicing). Air brake system valves are required to tolerate a light coating of oil. **Normal**

- A small amount of oil does not affect SAE J2024** compliant valves.
- Check that regular maintenance is being performed and that the amount of oil in the air tanks (reservoirs) is within the acceptable range shown on the Bendix® BASIC test cup (see also column 5 of Table A on page 3). Return the vehicle to service.

For oil-sensitive systems, see page 2.

**SAE J2024 outlines tests all air brake system pneumatic components need to be able to pass, including minimum levels of tolerance to contamination.**

|  | (c) Porous compressor head casting. | ⇒ If casting porosity is detected, replace the compressor. |

| 18.0 Noisy compressor (multi-cylinder compressors only) | (a) Damaged compressor. | ⇒ Replace the compressor. |

---

**Other Miscellaneous Areas to Consider**

This guide attempts to cover most compressor system problems. Here are some rare sources of problems not covered in this guide:
- Turbocharger leakage. Lubricating oil from leaking turbocharger seals can enter the air compressor intake and give misleading symptoms.
- Where a compressor does not have a safety valve installed, if a partial or complete discharge line blockage has occurred, damage can occur to the connecting rod bearings. Damage of this kind may not be detected and could lead to compressor problems at a later date.
Tests

Test 1: Excessive Oil Leakage at the Head Gasket

Exterior leaks at the head gasket are not a sign that oil is being passed into the air charging system. Oil weepage at the head gasket does not prevent the compressor from building air.

Observe the amount of weepage from the head gasket.

If the oil is only around the cylinder head area, it is acceptable (return the vehicle to service), but, if the oil weepage extends down to the nameplate area of the compressor, the gasket can be replaced.

Test 2: Air Brake System and Accessory Leakage

Inspect for air leaks when working on a vehicle and repair them promptly.

Park the vehicle on level ground and chock wheels.

Build system pressure to governor cut-out and allow the pressure to stabilize for one minute.

**Step 1:** Observe the dash gauges for two additional minutes without the service brakes applied.

**Step 2:** Apply the service brakes and allow the pressure to stabilize. Continue holding for two minutes (you may use a block of wood to hold the pedal in position.) Observe the dash gauges.

If you see any noticeable decrease of the dash air gauge readings (i.e. more than 4 psi, plus two psi for each additional trailer) during either two minute test, repair the leaks and repeat this test to confirm that they have been repaired.

Air leaks can also be found in the charging system, parking brakes, and/or other components - inspect and repair as necessary.

Test 3: Air Compressor Discharge Temperature and Air Dryer Inlet Temperature*

(* Note that only vehicles that have passed Test 2 would be candidates for this test.)

Caution: The temperatures used in this test are not normal vehicle conditions. Above normal temperatures can cause oil (as vapor) to pass through the air dryer into the air brake system.

This test is run with the engine at normal operating temperature, with engine at max. rpm. If available, a dynamometer may be used.

1. Allow the compressor to build the air system pressure to governor cut-in.
2. Pump the brakes to bring the dash gauge pressure to 90 psi.
3. Allow the compressor to build pressure from 95 to 105 psi gauge pressure and maintain this pressure range by cycling the brakes for five (5) minutes.
4. Then, while maintaining max rpm and pressure range, measure and record the surface temperature of the fittings:
   - at the compressor discharge port. (T1).
   - at the air dryer inlet fitting. (T2).

Use a touch probe thermocouple for measuring the temperature.

5. See table below.
6. Retest before returning the vehicle to service.

<table>
<thead>
<tr>

</tr>
<tr>
<td>over 360°F —</td>
<td></td>
<td>Compressor is running hot. Check coolant 4(f) and/or discharge line 4(g).</td>
</tr>
</tbody>
</table>
Test 4: Governor Malfunction

1. Inspect control lines to and from the governor for restrictions (e.g. collapsed or kinked). Repair as necessary.
2. Using a calibrated external gauge in the supply reservoir, service reservoir, or reservoir port of the Bendix® D-2® governor, verify cut-in and cut-out pressures are within vehicle OEM specification.
3. If the governor is malfunctioning, replace it.

Test 5: Governor Control Line

1. Ensure that the governor control line from the reservoir is located at or near the top of the reservoir. (This line, if located near the bottom of the reservoir, can become blocked or restricted by the reservoir contents e.g. water or ice.)
2. Perform proper reservoir drain intervals and air dryer cartridge maintenance per Maintenance Schedule and Usage Guidelines (Table A on page 3).
3. Return the vehicle to service.

Test 6: Compressor Unloader Leakage

Bendix® Compressors: Park vehicle, chock wheels, and follow all standard safety procedures. Remove the governor and install a fitting to the unloader port. Add a section of air hose (min 1 foot long for a 1/2" diameter line) and a gauge to the fitting followed by a shut-off valve and an air source (shop air or small air tank). Open the shut off and charge the unloader port by allowing air pressure to enter the hose and unload the compressor. Shut off the air supply and observe the gauge. A steady reading indicates no leakage at the unloader port, but a falling reading shows that the unloader mechanism is leaking and needs to be serviced. See Bendix Technical Bulletin TCH-001-060 for more information on unloader pistons.
Appendix: Information about the Bendix® BASIC™ Test Kit (Bendix P/N 5013711)

Service writer records info - including the number of days since all air tanks were drained - and fills out symptom checklist. Technician inspects items.

**START BASIC TEST**

Park vehicle on LEVEL ground. Chock wheels, drain air from system.

Drain contents of ALL air tanks into BASIC™ cup

Is there less than one unit of liquid?

**YES**

Vehicle OK. Return vehicle to service.

**END TEST**

**NO**

Is there more than one unit of:
- water, or
- cloudy emulsion mixture?

**YES**

**H₂O** Cloudy emulsion mixture

**NO**, only oil.

**YES**, this is a high air use vehicle.

**NO**, this is a low air use vehicle.

Is this a transit vehicle, bulk unloader, or has more than 5 axles?

**YES**

Find the point on the label where the number of oil units meets the number of days* since the vehicle’s air tanks were last drained.

Is the point above the HIGH Oil Use Line on the cup?

**NO**

Test for air leakage

**YES**

Use Test 2: Air Leakage

Does the vehicle have excessive air leakage?

**YES**

Repair leaks and return vehicle to service

**END TEST**

**NO**

Was the number of days since last draining known?

**NO** (did not know when last drained)

Re-test with the BASIC™ Test after 30 days***

**END TEST**

**YES**, number of days was known (30 – 90 days)

Replace the Compressor. If under warranty, follow standard procedures.

If, after a compressor was already replaced, the vehicle fails the BASIC test again, do not replace the compressor**** - use the Advanced Troubleshooting Guide to investigate the cause(s).

**END TEST**

**YES**

Find the point on the label where the number of oil units meets the number of days* since the vehicle’s air tanks were last drained.

Is the point above the LOW Oil Use Line on the cup?

**NO**

Test for air leakage

**YES**

Use Test 2: Air Leakage

Does the vehicle have excessive air leakage?

**YES**

Repair leaks and return vehicle to service

**END TEST**

**NO**

Was the number of days since last draining known?

**NO** (did not know when last drained)

Re-test with the BASIC™ Test after 30 days***

**END TEST**

**YES**, number of days was known (30 – 90 days)

Replace the Compressor. If under warranty, follow standard procedures.

If, after a compressor was already replaced, the vehicle fails the BASIC test again, do not replace the compressor**** - use the Advanced Troubleshooting Guide to investigate the cause(s).

**END TEST**

**Note:** Typical air dryer cartridge replacement schedule is every 3 yrs/ 300K miles for low air use vehicles and every year/100K miles for high air use vehicles.

**To get an accurate reading for the amount of oil collected during a 30 day period, ask the customer not to drain the air tanks before returning.** (Note that 30-90 days is the recommended air tank drain schedule for vehicles equipped with a Bendix air dryer that are properly maintained.)

**If, in cold weather conditions, the 30 day air tank drain schedule is longer than the customer’s usual draining interval, the customer must determine, based on its experience with the vehicle, whether to participate now, or wait for warmer weather. See the cold weather tips in Bendix® Bulletins TCH-008-021 and TCH-008-022.

***Note:** After replacing a compressor, residual oil may take a considerable period of time to be flushed from the air brake system.
Appendix continued: Information about the BASIC Test Kit (Bendix P/N 5013711)

Filling in the Checklist for the Bendix® Air System Inspection Cup (BASIC) Test

Note: Follow all standard safety precautions. For vehicles using a desiccant air dryer.

The Service Writer fills out these fields with information gained from the customer.

Customer’s Complaint
(Please check all that apply)

- “Relay valve □ leaks oil / □ malfunctions” □ no □ yes*
- “Dash valve □ leaks oil / □ malfunctions” □ no □ yes*
- “Air dryer leaks oil” □ no □ yes*
- “Governor malfunction” □ no □ yes*
- “Oil in gladhands” □ no □ yes*

- how much oil did you find?
- “Oil on ground or vehicle exterior” □ no □ yes*
- amount described:
- “Short air dryer cartridge life” replaces every: □ miles, □ kms, or □ months
- “Oil in air tanks” amount described:
- We will measure amount currently found when we get to step B of the test.
- “Excessive engine oil loss” amount described:
- Is the engine leaking oil? □ no □ yes*
- Is the compressor leaking oil? □ no □ yes*
- Other complaint:
- □ No customer complaint.

The Service Writer also checks off any complaints that the customer makes to help the Technician in investigating.

The Technician checks boxes for any of the complaints that can be confirmed.

*Note: A confirmed complaint above does NOT mean that the compressor must be replaced. The full BASIC test below will investigate the facts.

BASIC test starts here:  

STEP A - Select one:

- This is a low air use vehicle: Line haul (single trailer) with 5 or less axles, or
- This is a high air use vehicle: Garbage truck, transit bus, bulk unloader, or line haul with 6 or more axles.

Then go to Step B.

STEP B - Measure the Charging System Contents

1. Park and chock vehicle on level ground. Drain the air system by pumping the service brakes.
2. Completely drain ALL the air tanks into a single BASIC cup.
3. If there is less than one unit of contents total, end the test now and return the vehicle to service. Vehicle passes.
4. If more than one oil unit of water (or a cloudy emulsion mixture) is found:
   (a) Change the vehicle’s air dryer cartridge - see Footnote 1,
   (b) Conduct the 4 minute leakage test (Step D),
   (c) STOP the inspection, and check the vehicle again after 30 days - see Footnote 2.

Otherwise, go to Step C.

Note for returning vehicles that are being retested after a water/cloudy emulsion mixture was found last time and the air dryer cartridge replaced: If more than one oil unit of water or a cloudy emulsion mixture is found again, stop the BASIC test and consult the air dryer’s Service Data sheet troubleshooting section.

Footnotes:
1. Typical air dryer cartridge replacement schedule is every 3 yrs/ 300K miles for low air use vehicles and every year/100K miles for high air use vehicles.
2. To get an accurate reading for the amount of oil collected during a 30 day period, ask the customer not to drain the air tanks before returning. (Note that 30-90 days is the recommended air tank drain schedule for vehicles equipped with a Bendix air dryer that are properly maintained.) If, in cold weather conditions, the 30 day air tank drain schedule is longer than the customer’s usual draining interval, the customer must determine, based on its experience with the vehicle, whether to participate now, or wait for warmer weather. See the cold weather tips in Bendix® Bulletins TCH-008-021 and TCH-008-022.
Appendix continued: Information about the BASIC Test Kit (Bendix P/N 5013711)

Filling in the Checklist for the Bendix® Air System Inspection Cup (BASIC) Test
Note: Follow all standard safety precautions. For vehicles using a desiccant air dryer.

STEP C - How to Use the BASIC Test

The Technician uses the chart (label) on the BASIC test cup to help decide the action to take, based on the amount of oil found. Use the lower acceptance line for low air use vehicles, and upper line for high air use vehicles (from Step A).

BASIC Test Example

An oil level of 4 units in a sixty-day period is within the acceptance area (at or below the line) for both low and high air use vehicles. Return the vehicle to service.

The Technician looks for the point where the number of days since the air tanks were drained meets the oil level. If it is at or below the (low or high use) acceptance line, the vehicle has passed the test. If the point is above the line, we go to the leakage test.

STEP D - Air Brake System Leakage Test

Park the vehicle on level ground and chock wheels. Build system pressure to governor cut-out and allow the pressure to stabilize for one minute.
1: Observe the dash gauges for two additional minutes without the service brakes applied.
2: Apply service brakes for two minutes (allow pressure to stabilize) and observe the dash gauges.

If you see any noticeable decrease of the dash air gauge readings repair leaks. Repeat this test to confirm that air leaks have been repaired and return vehicle to service. Please repeat BASIC test at next service interval. Note: Air leaks can also be found in the charging system, parking brakes, and/or other components - inspect and repair as necessary.

If no air leakage was detected, and if you are conducting this test after completing Step C, go to Step E.

STEP E - If No Air Leakage Was Detected In Step D

Replace the compressor.

Note: If the compressor is within warranty period, please follow standard warranty procedures. Attach the completed checklist to warranty claim.
